### **CLASE JUEVES-24-JUNIO-2021**

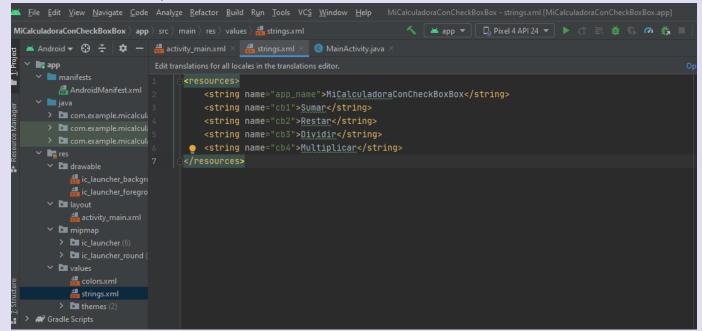

# **INICIO DE CLASE-**

Aprenderemos a utilizar SWITCH.

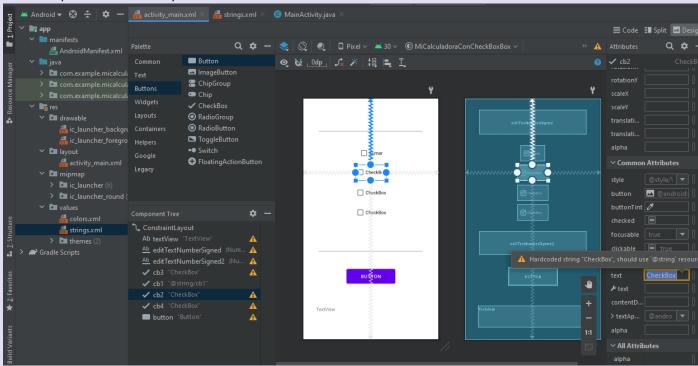

Primero lo primero, nombrar los componentes

Acá ingreso el texto o valor que quiero que mis componentes muestren en pantalla (ya no lo hacemos desde el diseño)

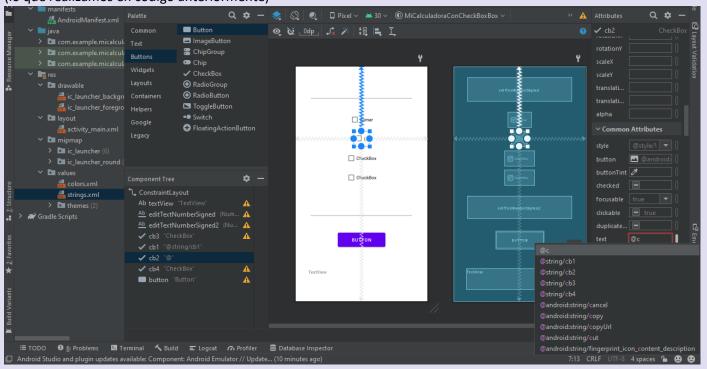

Recordar posicionar los componentes

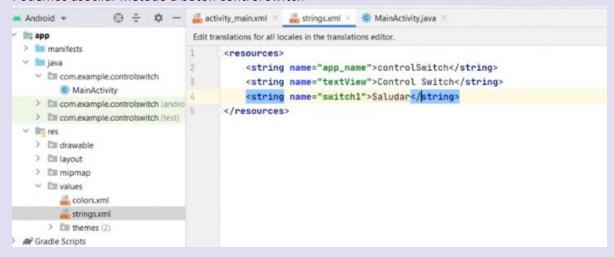

Acá ingresar las strings de mis componentes, (en texto y hint)

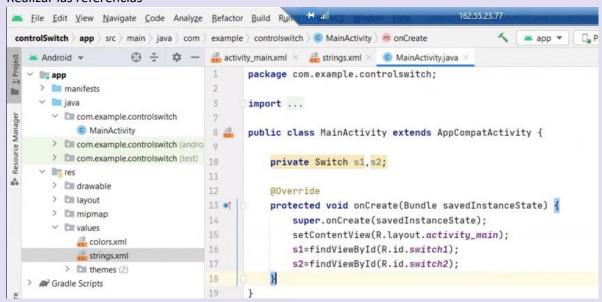

(lo que realizamos en código anteriormente)

### Podemos asociiar método a botón control switch

## Realizar las referencias

Acá introducimos nuestro código hermoso que hace que todo funcione <3

```
package com.example.controlswitch;
app
> manifests
∨ 🖿 java
                                                                                                               3
                                                                                                                                      import ...

                                                        int suma=valor1+valor2;
                                    38
                                                        tv1.setText("La suma es: "+suma);
                                    39
                                                    }else if(op.equals("Restar")){
                                                        int resta=valor1-valor2;
                                                        tv1.setText("La resta es: "+resta);
```

2) Realizar app con Spinner

15:27 🛇 🖼 🔒 ·	<b>12 ¥ ≈</b> 87% <b>i</b>	
Spinner		
5		
6		
		Funciona! (:
restar	*	
CALCULAR		
	l.	
La resta es -1		

**FIN CLASE-**

**POST CLASE-**

Debo recordar agregar el ONCLICK cuando creo botones, porque siempre se me olvida y mis botones no funcionan y lo recuerdo luego de probar la app.

Me hubiese gustado realizar una interfaz más linda pero el tiempo, el tiempo...

En general creo que voy bien, el código se me hace cada vez más cercano, y descubrí que me encanta también (: jsdh
